

# A <Basic> C++ Course

## 10 - SumUp

*Julien Deantoni*

# Object-Oriented concepts

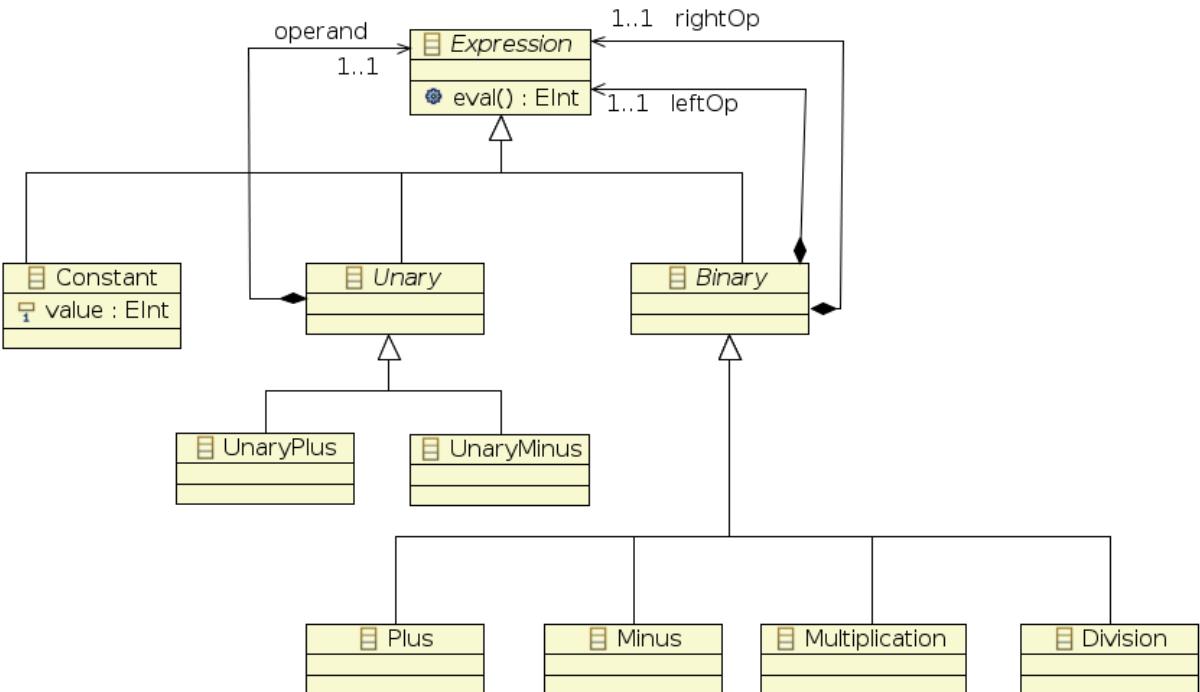

- A class diagram gives
  - structural aspects
  - relational aspects

# Object-Oriented concepts

- A class diagram gives
    - structural aspects
    - relational aspects

No description of  
the algorithmic  
behaviors

# Object-Oriented concepts

- A class diagram gives
  - structural aspects
  - relational aspects

No description of  
the algorithmic  
behaviors

How does eval()  
behave ?

```
class Expression
{
public:

    class ZeroDivide : public exception
    {
public:
    const char* what() const throw () {return "Division
        by 0";}
};

    virtual int eval() const = 0;
};
```

# Object-Oriented concepts

- A class diagram gives
  - structural aspects
  - relational aspects

No description of  
the algorithmic  
behaviors

How does eval()  
behave ?

```
class Expression
{
public:

    class ZeroDivide : public exception
    {
public:
    const char* what() const throw () {return "Division
        by 0";}
};

virtual int eval() const = 0;
};
```

# Object-Oriented concepts

No description of  
the algorithmic  
behaviors

How does eval()  
behave ?

```
class Expression
{
public:

    class ZeroDivide : public exception
    {
public:
    const char* what() const throw () {return "Division
        by 0";}
};

virtual int eval() const = 0;
};
```

Reflexe associé ?

# Object-Oriented concepts

- A class diagram gives
  - structural aspects
  - relational aspects

No description of the algorithmic behaviors

How does eval()  
behave ?

```
class Expression
{
public:

    class ZeroDivide : public exception
    {
public:
        const char* what() const throw () {return "Division
by 0";}
    };

    virtual ~Expr() = default;  Reflexe associé ?
    virtual int eval() const = 0;
};
```

# Object-Oriented concepts

- A class diagram gives
  - structural aspects
  - relational aspects

No description of the algorithmic behaviors

```
class Unary : public Expression
{
protected:
    Expr* operand;
public:
    Unary(Expr& pe);
    virtual int eval() const = 0;
    virtual ~Unary();
};
```

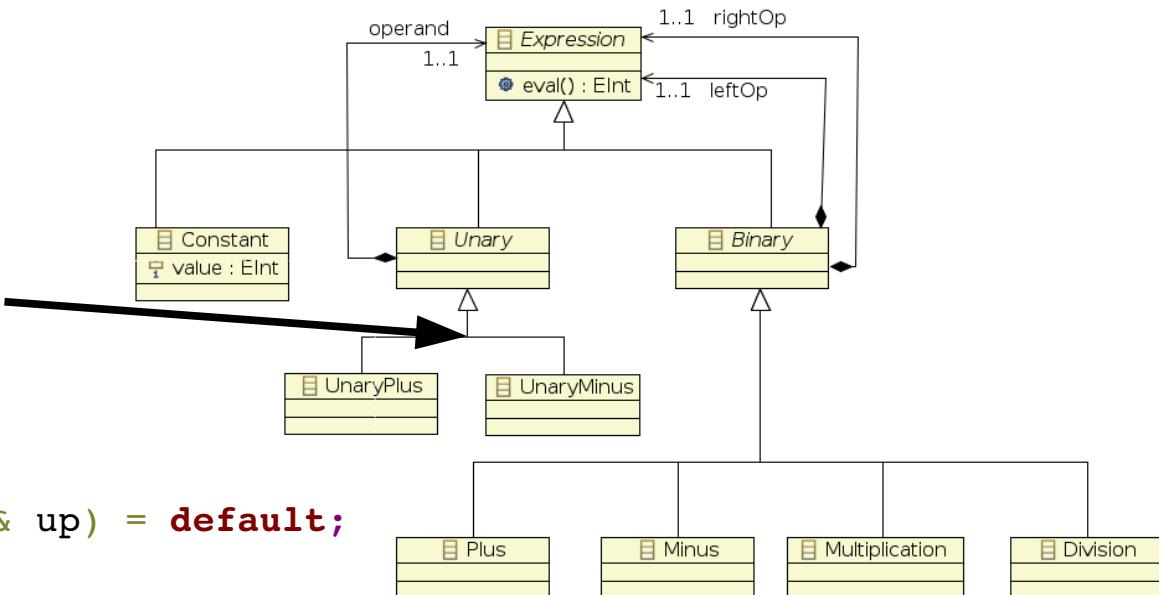

# Object-Oriented concepts

- A class diagram gives
  - structural aspects
  - relational aspects

No description of the algorithmic behaviors

```
class UnaryPlus : public Unary
{
public:
    Unary_Plus(Expr& pe);
    Unary_Plus(const Unary_Plus& up) = default;
    int eval() const override;
};
```

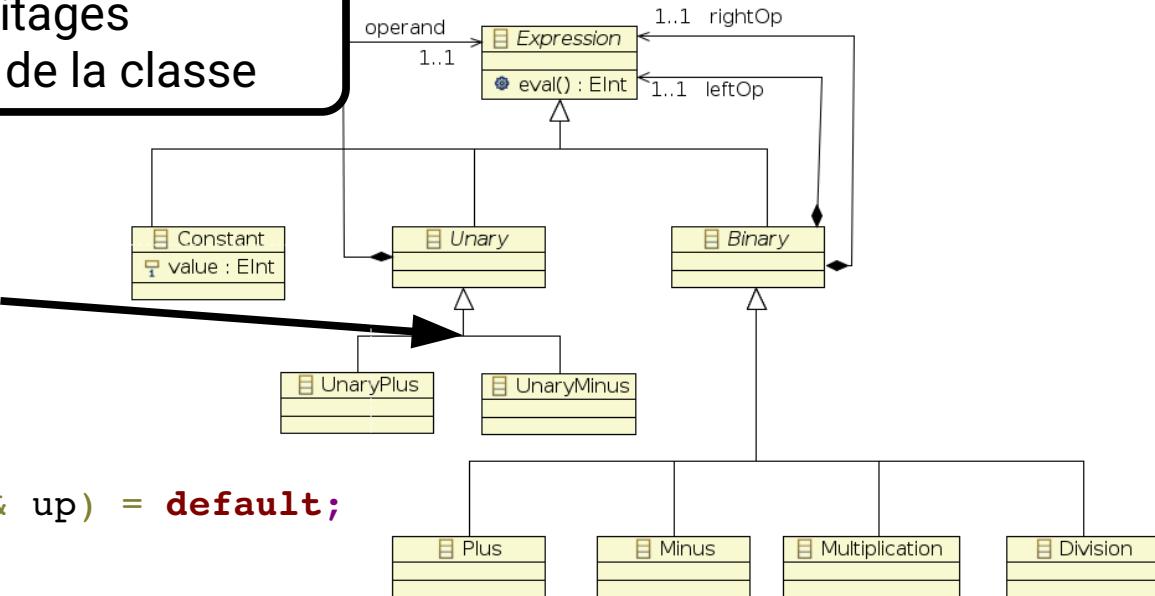

# Object-Oriented concepts

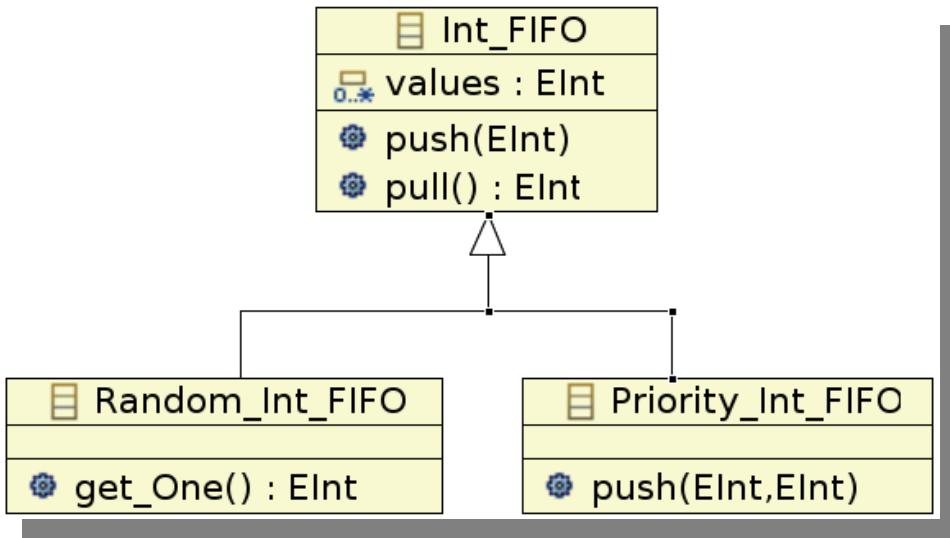

- A class diagram gives
  - structural aspects
  - relational aspects

Différents types d'héritages  
pour « modifier » l'interface de la classe

```
class UnaryPlus : public Unary
{
public:
    Unary_Plus(Expr& pe);
    Unary_Plus(const Unary_Plus& up) = default;
    int eval() const override;
};
```

# Derivation public / private

- What if we declare `Random_Int_FIFO` like that ?

```
class Random_Int_FIFO : private Int_FIFO
{
    public:
        int get_One();
}
```

# Derivation public / private

- The private derivation
  - All members of derived class become private
  - The “interface” of the derived class is lost...
    - **private derivation is not a “is a” relation anymore !**
    - **private derivation is closer to a “has a” relation.**
    - **Private inheritance means “is implemented in terms of”. It's usually inferior to composition** [Effective Modern C++. Scott Meyers]

```
class Random_Int_FIFO : private Int_FIFO
{
    public:
        int get_One();
}
```

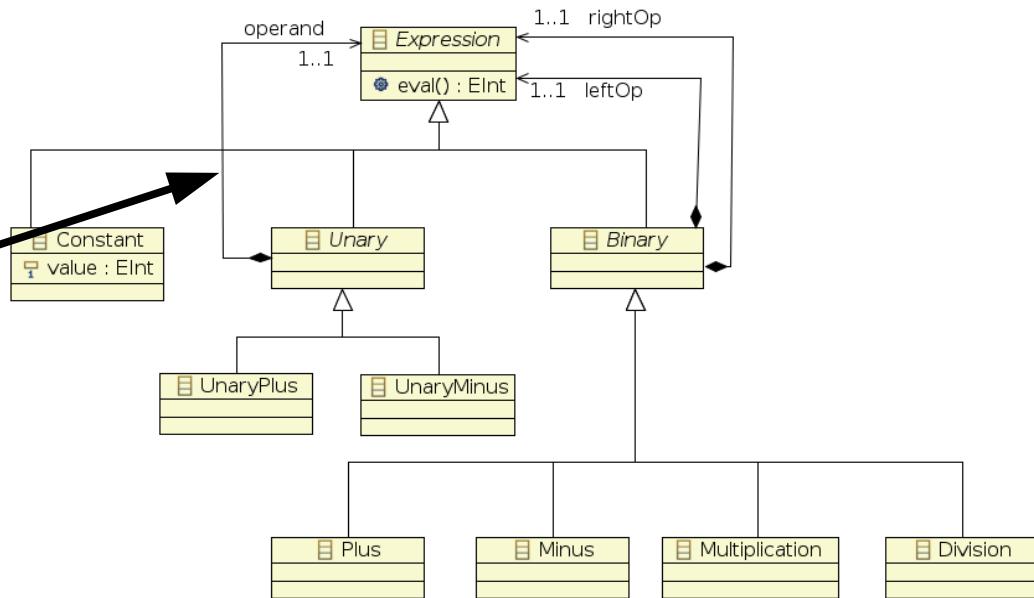

# Object-Oriented concepts

- A class diagram gives
  - structural aspects
  - relational aspects

Remember the impact  
of the containment

No description of  
the behaviours

```
class Unary : public Expression
{
protected:
    Expr* operand;
public:
    Unary(Expr& pe);
    virtual int eval() const = 0;
    virtual ~Unary();
};
```

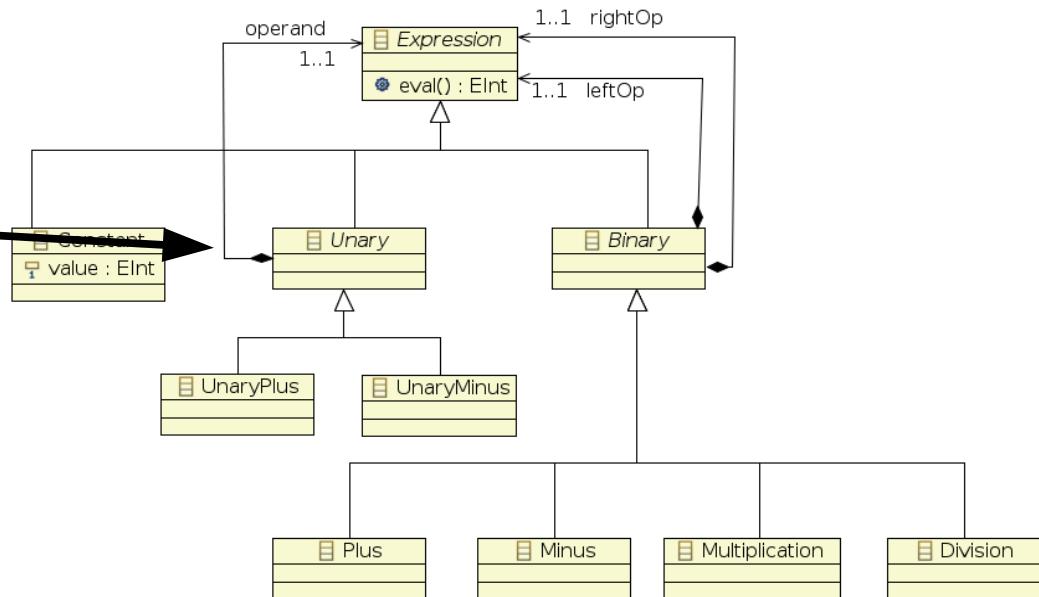

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

```
Unary::Unary(Expression& pe)
: operand{pe.clone()}{}}

Expression* UnaryPlus::clone()
{
  return new UnaryPlus(*this);
}
```

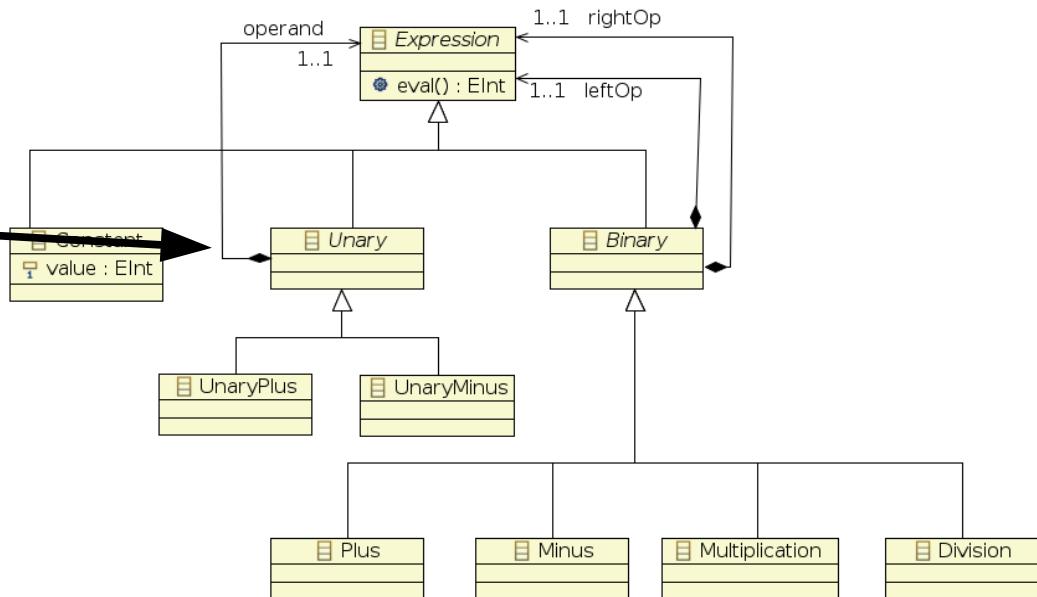

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

```
Unary::Unary(Expression& pe)
{
  operand = pe.clone();
}
```

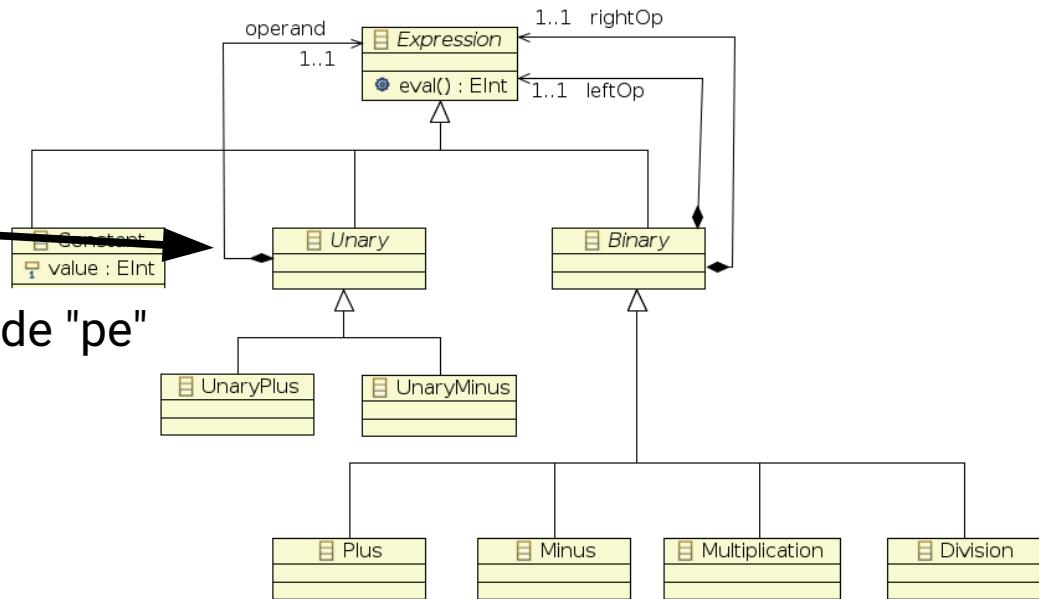

```
Expression* UnaryPlus::clone()
{
  return new UnaryPlus(*this);
}
```

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

```
Unary::Unary(Expression& pe)
{
  operand = pe.clone();
}
Expression* UnaryPlus::clone()
{
  return new UnaryPlus(*this);
}
```

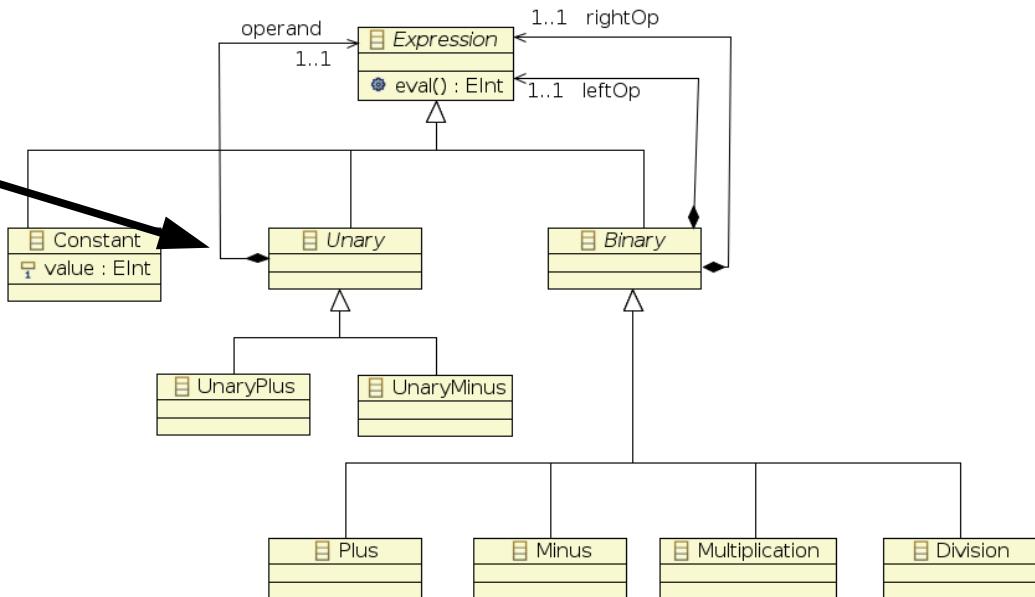

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

```
Unary::Unary(Expression& pe)
{
    operand = pe.clone();
}

Expression* UnaryPlus::clone()
{
    return new UnaryPlus(*this);
}

Unary::~Unary()
{
    delete operand;
}
```

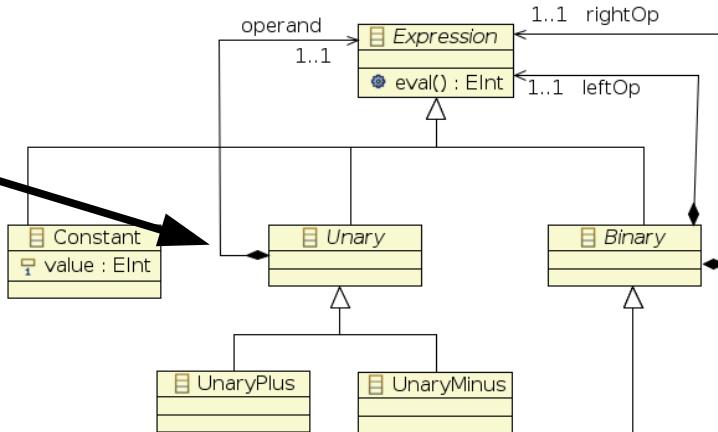

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

```
Unary::Unary(Expression& pe)
{
  operand = pe.clone();
}
```

```
Expression* UnaryPlus::clone()
{
  return new UnaryPlus(*this);
}
```

```
Unary::~Unary()
{
  delete operand;
}
```

**Appel au constructeur de copie !**

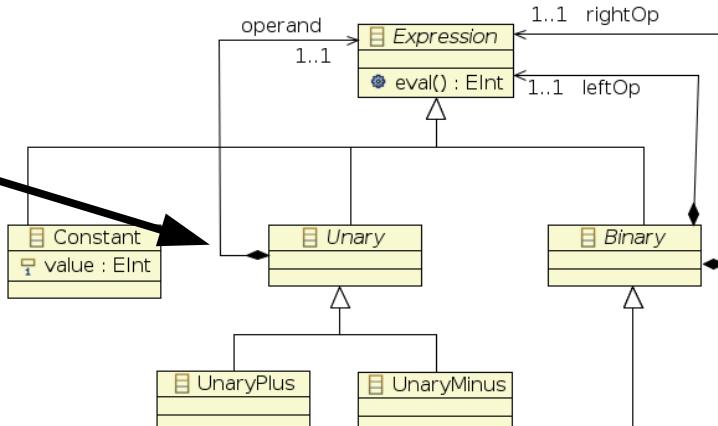

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

```
Unary::Unary(Expression& pe)
{
  operand = pe.clone();
}
```

```
Expression* UnaryPlus::clone()
{
  return new UnaryPlus(*this);
}
```

```
Unary::~Unary()
{
  delete operand;
}
```

**Appel au constructeur de copie !  
À définir ?**

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

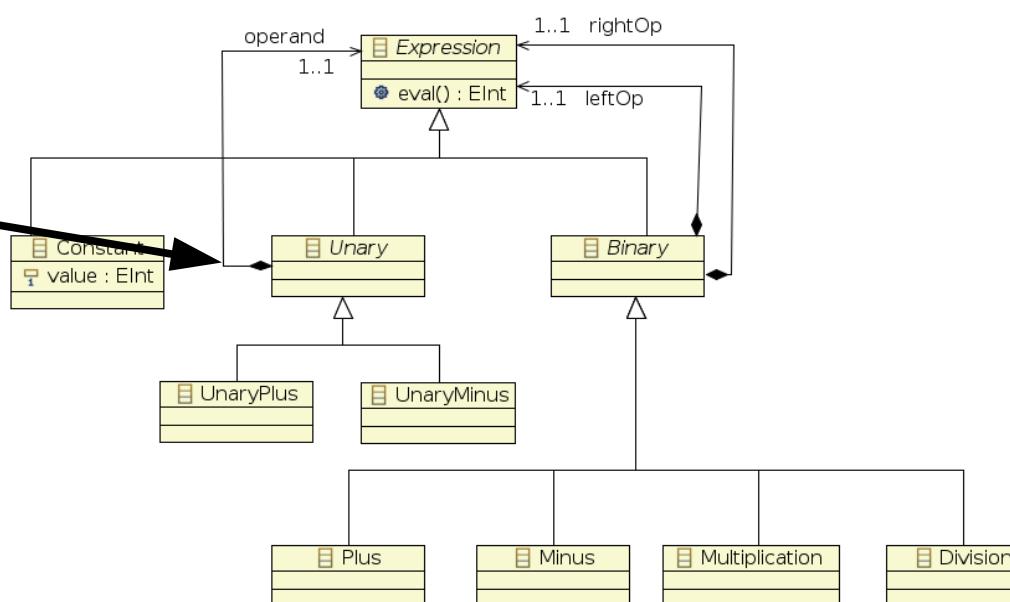

```

Unary::Unary(const Unary& un)
{
  operand = un.op->clone();
}
Unary::Unary(Expression& pe)
{
  operand = pe.clone();
}

Expression* UnaryPlus::clone()
{
  return new UnaryPlus(*this);
}

Unary::~Unary()
{
  delete operand;
}
  
```

**Suffisant ou à redéfinir dans UnaryPlus ?**

# Object-Oriented concepts

- Impact of containment:

- The life of contained object(s) is your responsibility

```

Unary::Unary(const Unary& un)
{
    operand = un.op->clone();
}

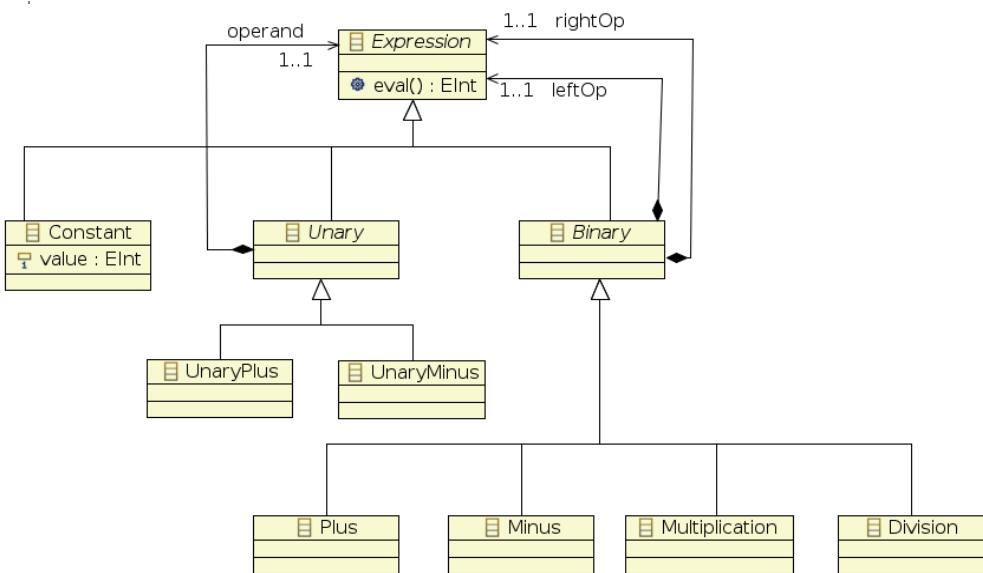

Unary::Unary(Expression& pe)
{
    operand = pe.clone();
}

Expression* UnaryPlus::clone()
{
    return new UnaryPlus(*this);
}

Unary::~Unary()
{
    delete operand;
}

Unary& Unary::operator=(const Unary& un){
    delete operand ;
    operand = un.op->clone();
    return *this ;
}

```

Et bien sûr ça impose la définition de l'opérateur d'affectation...

# Object-Oriented concepts

- Impact of containment:

- The life of contained object(s) is your responsibility

```

Unary::Unary(const Unary& un)
{
    operand = un.op->clone();
}

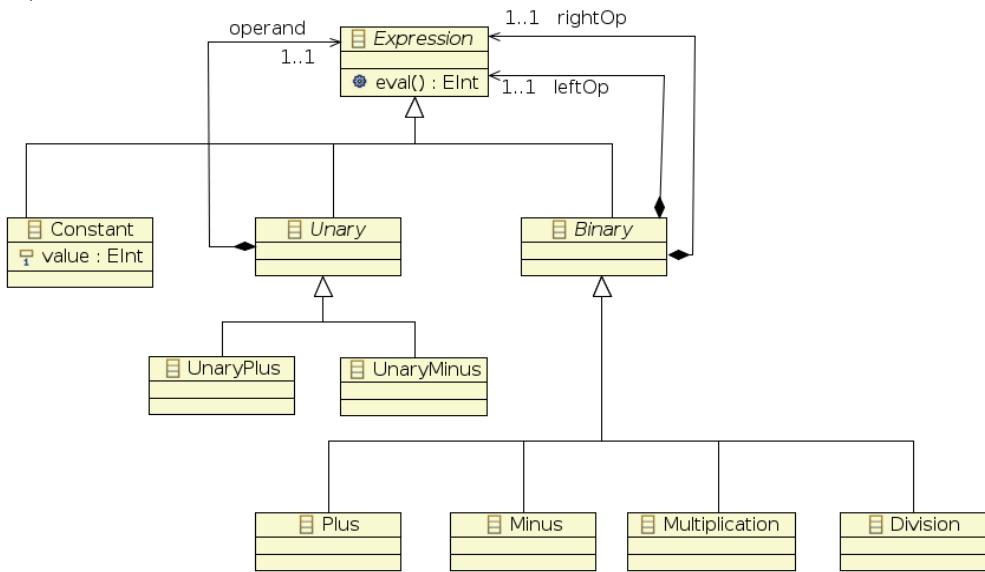

Unary::Unary(Expression& pe)
{
    operand = pe.clone();
}

Expression* UnaryPlus::clone()
{
    return new UnaryPlus(*this);
}

Unary::~Unary()
{
    delete operand;
}

Unary& Unary::operator=(const Unary& un){
    delete operand ;
    operand = un.op->clone();
    return *this ;
}

```

Et si l'on met un setter ?

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

```
class Unary : public Expression
```

```
{
```

```
protected:
```

```
/** not shared ! (contained) **/
```

```
Expr* operand;
```

```
public:
```

```
Unary(Expr& pe);
```

```
Unary(const Unary& un);
```

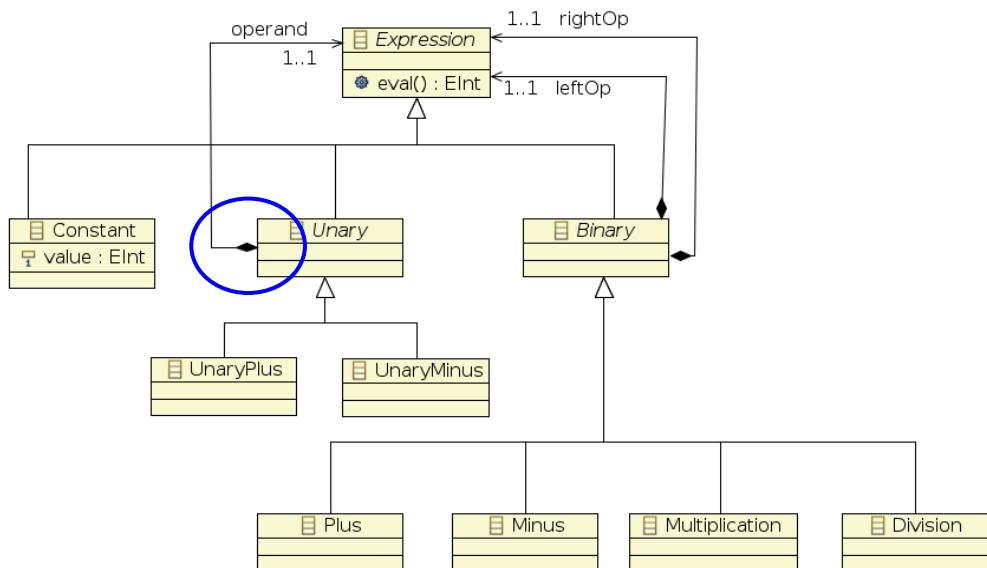

```
virtual Expression* clone() const = 0;
```

```
virtual int eval() const = 0;
```

```
virtual ~Unary();
```

```
}
```

KAIROS

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility

```
class UnaryPlus : public Unary{
```

**public:**

```
UnaryPlus(Expr& pe);
```

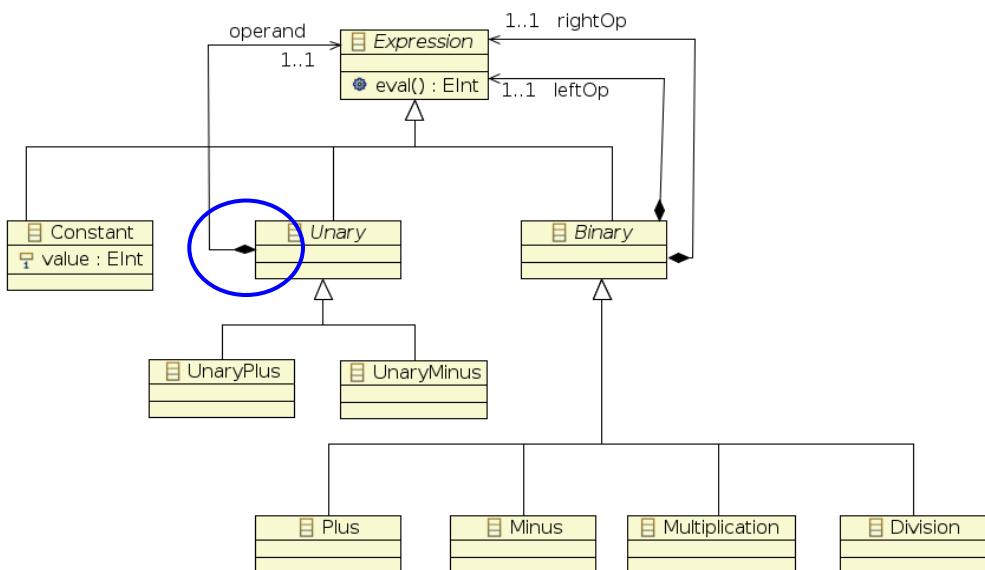

```
UnaryPlus(const Unary& un) = default;
```

```
Expression* clone() const override;
```

```
int eval() const override;
```

```
virtual ~UnaryPlus() = default;
```

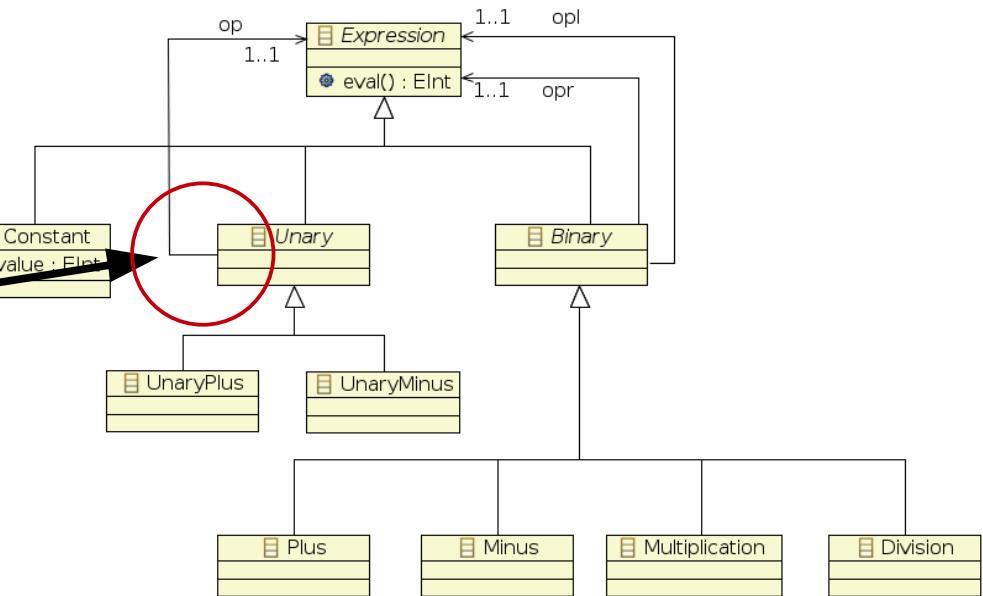

};

# Object-Oriented concepts

- Impact of containment:
  - The life of contained object(s) is your responsibility, not the life of a shared object

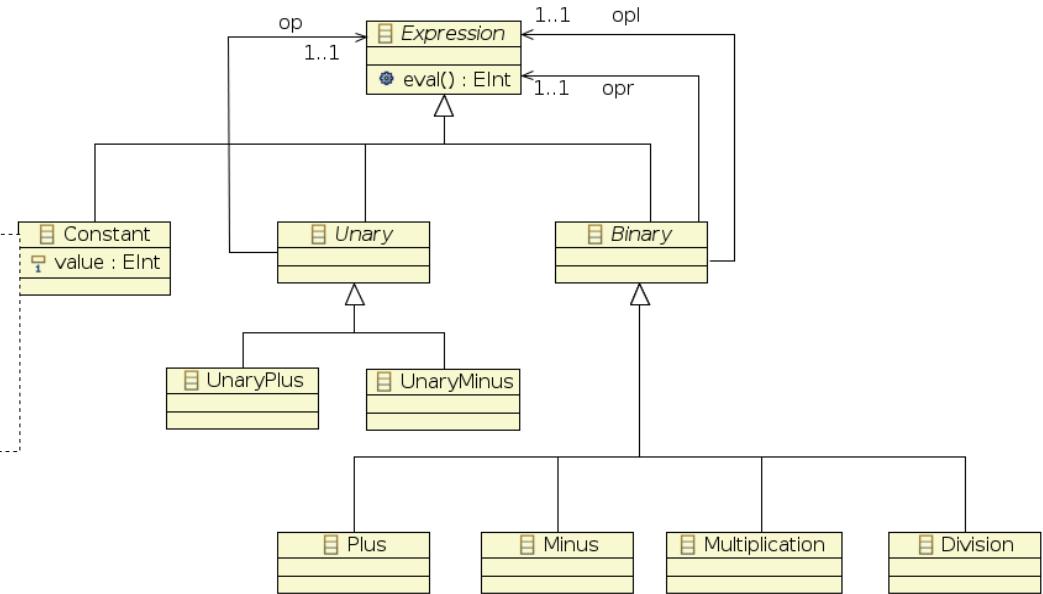

```
UnaryPlus::UnaryPlus(Expression& pe)
{
    operand = &pe
}
```

# Object-Oriented concepts

- Take care of object life duration

```
UnaryPlus::UnaryPlus(Expression& pe)
{
    operand = &pe
}
```

Here, no copied parameters  
can be accepted

# Object-Oriented concepts

- Take care of object life duration

}
```

# Object-Oriented concepts

- Take care of object life duration

```
main(){
    Constant a(3);
    UnaryPlus plus_a(a);
}
```

```
UnaryPlus::UnaryPlus(Expression pe)
{
    operand = &pe
}
```

# Object-Oriented concepts

- Take care of object life duration

```
main(){
    Constant a(3);
    UnaryPlus plus_a(a);
    plus_a.eval()      // problem
                      (segmentation fault)
}
```

```
UnaryPlus::UnaryPlus(Expression pe)
{
    operand = &pe
}
```

# Object-Oriented concepts

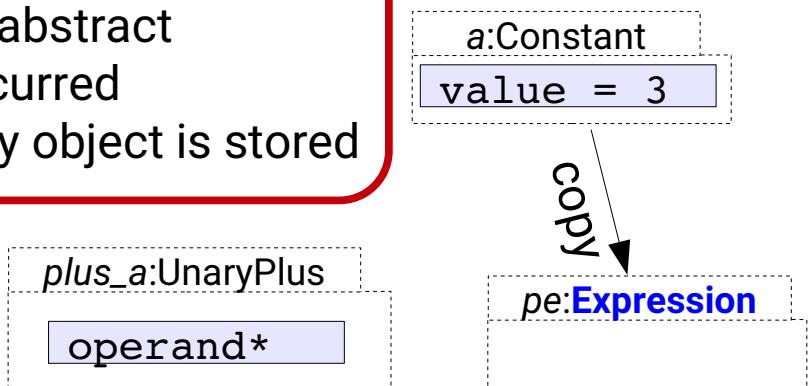

- Take care to truncation..

```
main(){
    Constant a(3);
    UnaryPlus plus_a(a);
}
```

```
UnaryPlus::UnaryPlus(Expression pe)
{
    operand = &pe
}
```

Triple wrong because here:

1. Expression is abstract
2. truncation occurred
3. @ of temporary object is stored

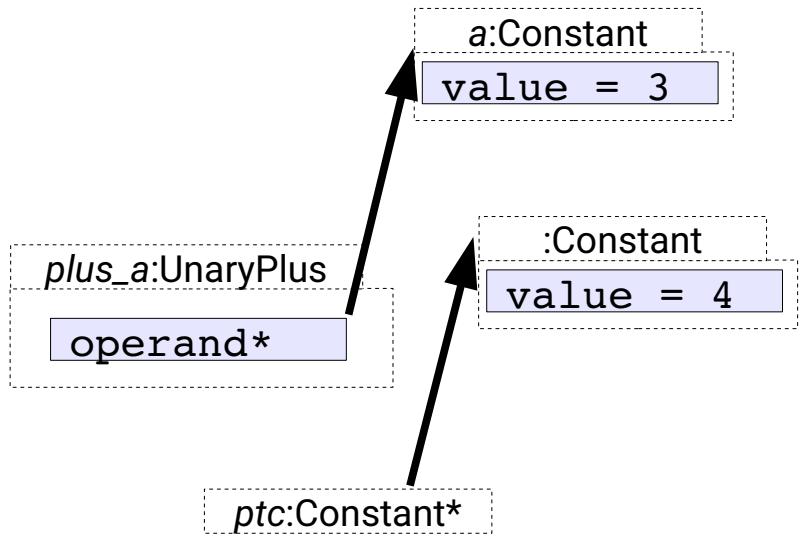

# Object-Oriented concepts

- Take care of object life duration

```
Main(){
    Constant* ptc = new Constant(4);

    Constant a(3);
    UnaryPlus plus_a(a);
}

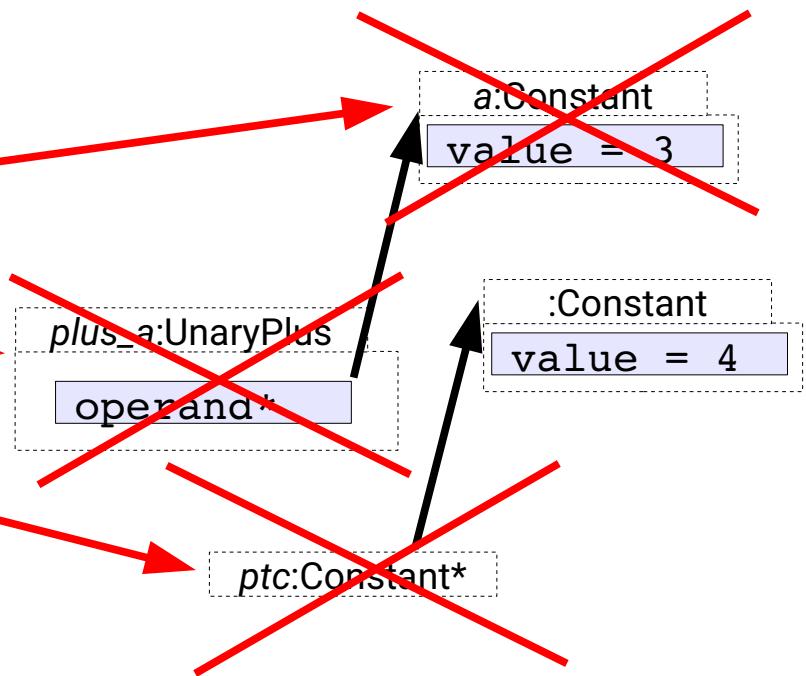

UnaryPlus::UnaryPlus(Expression& pe)
{
    operand = &pe
}
```

# Object-Oriented concepts

- Take care of object life duration

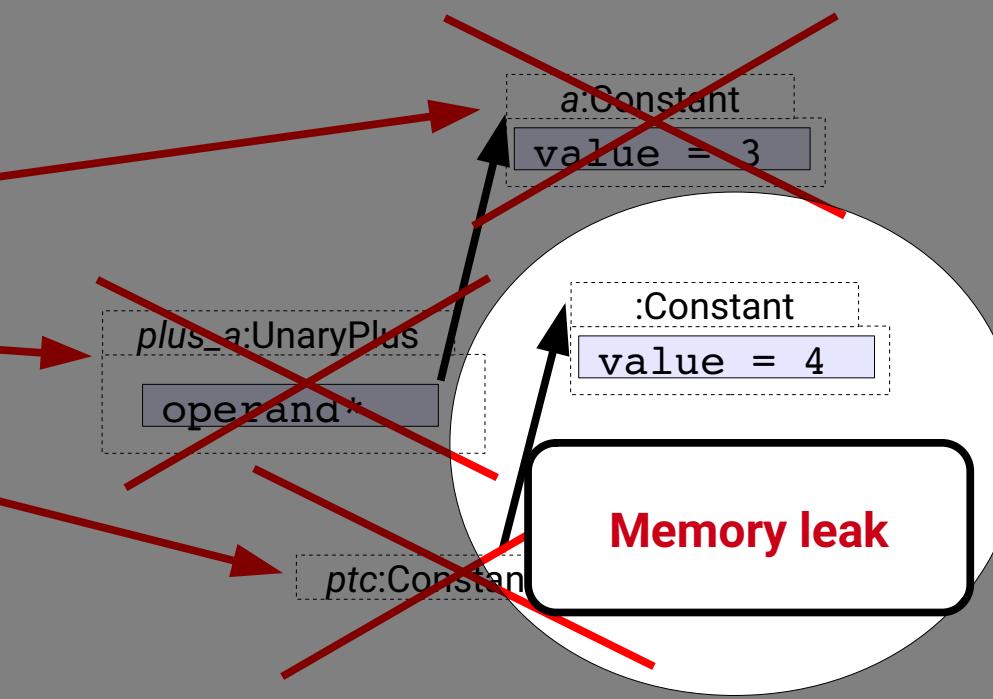

```
Main(){  
    Constant* ptc = new Constant(4);  
  
    Constant a(3);  
    UnaryPlus plus_a(a),  
}  
  
UnaryPlus::UnaryPlus(Expression& pe)  
{  
    operand = &pe  
}
```

# Object-Oriented concepts

- Take care of object life duration

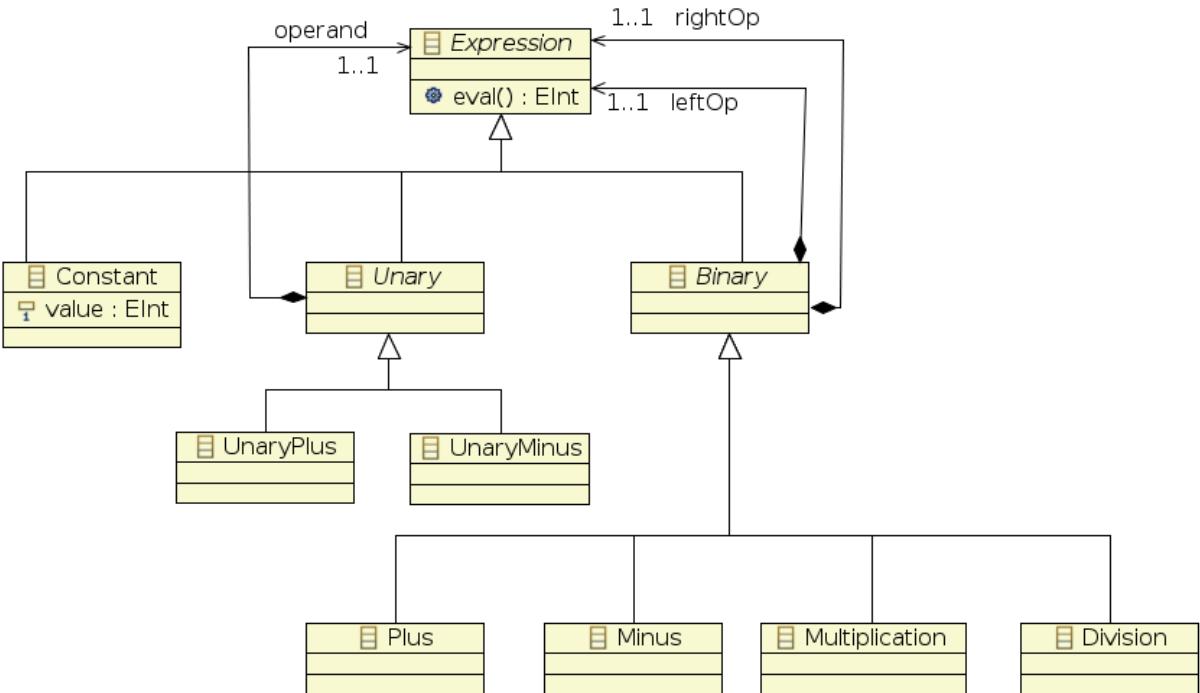

```
Main(){  
    Constant* ptc = new Constant(4);  
  
    Constant a(3);  
    UnaryPlus plus_a(a),  
}  
  
UnaryPlus::UnaryPlus(Expression& pe)  
{  
    operand = &pe  
}
```

# Object-Oriented concepts

- A class diagram gives
  - structural aspects
  - relational aspects

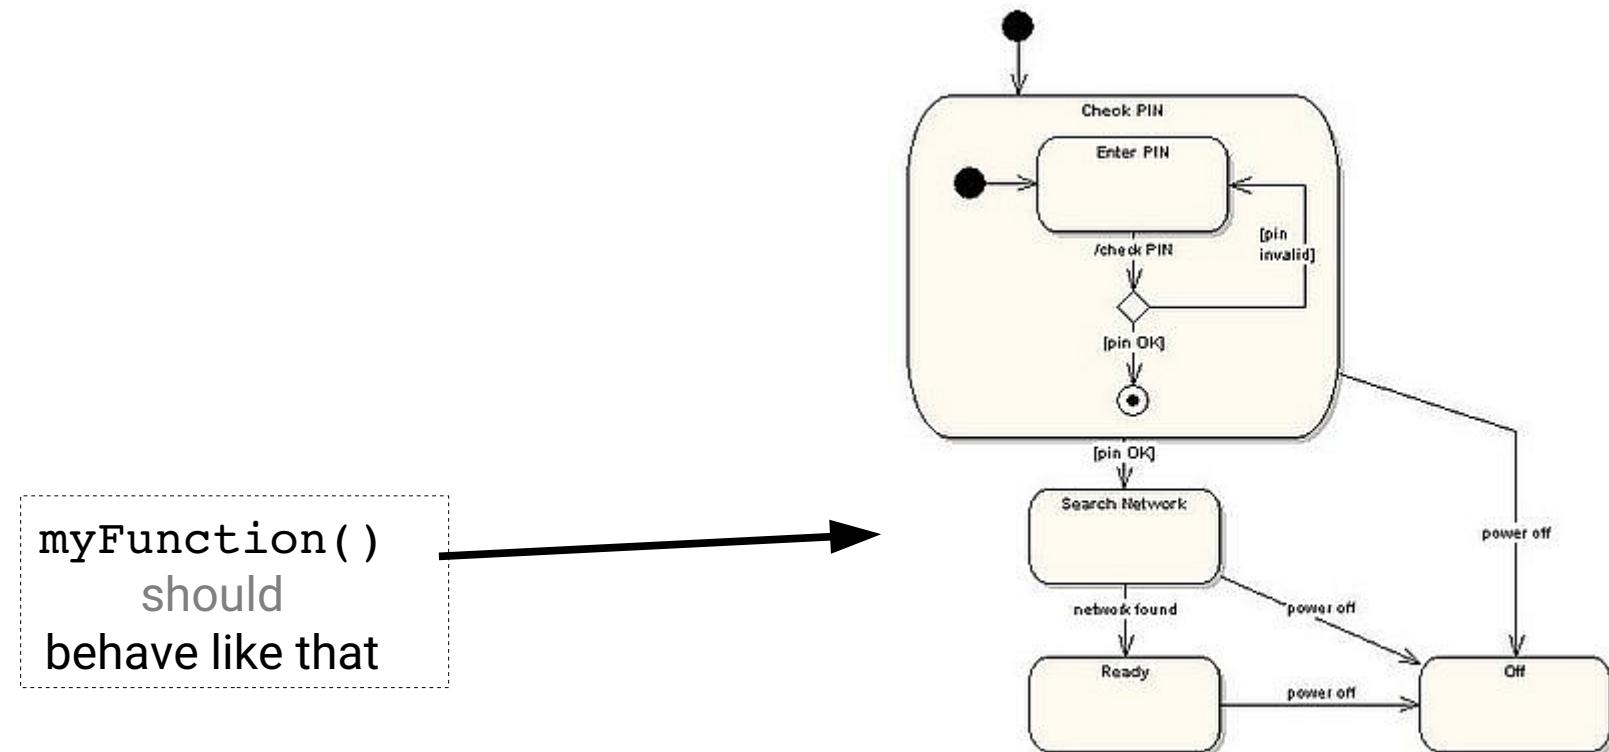

Almost equivalent to  
a set of .h files:  
*Expression.h*  
*Unary.h*  
*UnaryPlus.h*  
...

Be aware of previous  
comments !!

# Object-Oriented concepts

- UML can give much more (caricature)
  - Behavioral aspects
- Textual specification

# Object-Oriented concepts

  - ...

**Almost** equivalent to  
how the *main* uses objects:  
*system.h*  
*system.cpp*  
*main.cpp*

The system  
behave like that

# In a nutshell...

- Implementing a system:

## 1. Classes realization

- Declaration / definition of the class(es) --> .h
  - ≈ reflects the class diagram
- Implementing the class(es) --> .cpp
  - ≈ implements the (member) function(s) (activity diagram, stateCharts, sequence diagram, ...)

TEST !!

## 2. system realization

- Make use of class(es)
  - Predefined classes (for instance the STL ones)
  - The one previously defined (at step 1.)
  - Definition / implementation / uses of a « system » class

# In a nutshell...

- Implementing a system:

## 1. Classes realization

- Declaration / definition of the class(es) --> .h
  - ≈ reflects the class diagram
- Implementing the class(es) --> .cpp
  - ≈ implements the (member) function(s) (activity diagram, stateCharts, sequence diagram, ...)

TEST !!

## 2. system realization

- Make use of class(es)
  - Predefined classes (**for instance the STL ones**)
  - The one previously defined (at step 1.)
  - Definition / implementation / uses of a « system » class

# In a nutshell...

- Implementing a system:
