

A <Basic> C++ Course

1 - Introduction

Julien Deantoni

Contenu de l'UE (non contractuel)

- 1. Introduction, chaîne de compilation, compilation séparée, exemple simple
- 2. Programmation procédurale, structuration de code et passage de paramètres
- 3. Allocation Dynamique de mémoire et constructeurs
- 4. Constructeurs, suite, destructeurs et surcharge d'opérateurs
- 5. Divers et Rappels
- 6. Templates en C++
- 7. Exemple complet de la classe Document
- 8. POO part 1, explication au travers de la classe Document
- 9. POO part 2
- 10. POO part 3
- 11. Wrap-up
- 12. Lambda et programmation concurrente moderne

Plan

- Du C++ ? pourquoi ?
- Principales différences avec java ?
 - le langage
 - La mise en œuvre (Interprété vs compilé vs mixte)
- From C to C++
- Programming and abstraction
 - Exemple simple en C et sa compilation
 - Exemple en C
 - Exemple simple en C++ et sa compilation
 - Exemple en C++

Pourquoi C++ ?

- (encore) Très utilisé

TIOBE Index for August 2021

August Headline: Data Mining and AI languages are booming in the TIOBE index

Smart phones were the new hit many years ago. As a consequence, the programming languages that were used to write mobile applications became very popular as well. The best example of this is Objective-C, which peaked at position 3 in the TIOBE index, whereas it was only used to write apps for iPhones. Nowadays we have the same with data mining and AI. Programming languages in these fields are booming. The most striking example is Python that took over the second position from Java. Even old languages see a revival because of this, like the surge of Fortran. And, even more astonishing, we see Prolog re-entering the top 20 after 15 years... making an unexpected comeback. Prolog is used in IBM's Watson, one of the most well known AI engines. The only exception to all this is R, which is as opposed to the others, losing some positions. I guess Python is eating R's market share. Other interesting moves this month are: Rust from position #27 to #24 and Julia from position #35 to #26. Both Rust and Julia are strong candidates for a permanent top 20 position. – Paul Jansen CEO TIOBE Software

The TIOBE Programming Community index is an indicator of the popularity of programming languages. The index is updated once a month. The ratings are based on the number of skilled engineers world-wide, courses and third party vendors. Popular search engines such as Google, Bing, Yahoo!, Wikipedia, Amazon, YouTube and Baidu are used to calculate the ratings. It is important to note that the TIOBE index is not about the *best* programming language or the language in which *most lines of code* have been written.

The index can be used to check whether your programming skills are still up to date or to make a strategic decision about what programming language should be adopted when starting to build a new software system. The definition of the TIOBE index can be found [here](#).

Aug 2021	Aug 2020	Change	Programming Language	Ratings	Change
1	1		 C	12.57%	-4.41%
2	3		 Python	11.86%	+2.17%
3	2		 Java	10.43%	-4.00%
4	4		 C++	7.36%	+0.52%
5	5		 C#	5.14%	+0.46%
6	6		 Visual Basic	4.67%	+0.01%
7	7		 JavaScript	2.95%	+0.07%

Pourquoi C++ ?

- (encore) Très utilisé
 - <https://www.tiobe.com/tiobe-index/>
- Libre
- Performant
- ➔ Pourtant il souffre d'une mauvaise réputation comparé à JAVA

**Philosophie différente / complémentaire
à Java : à connaître**

Différences avec JAVA

le langage

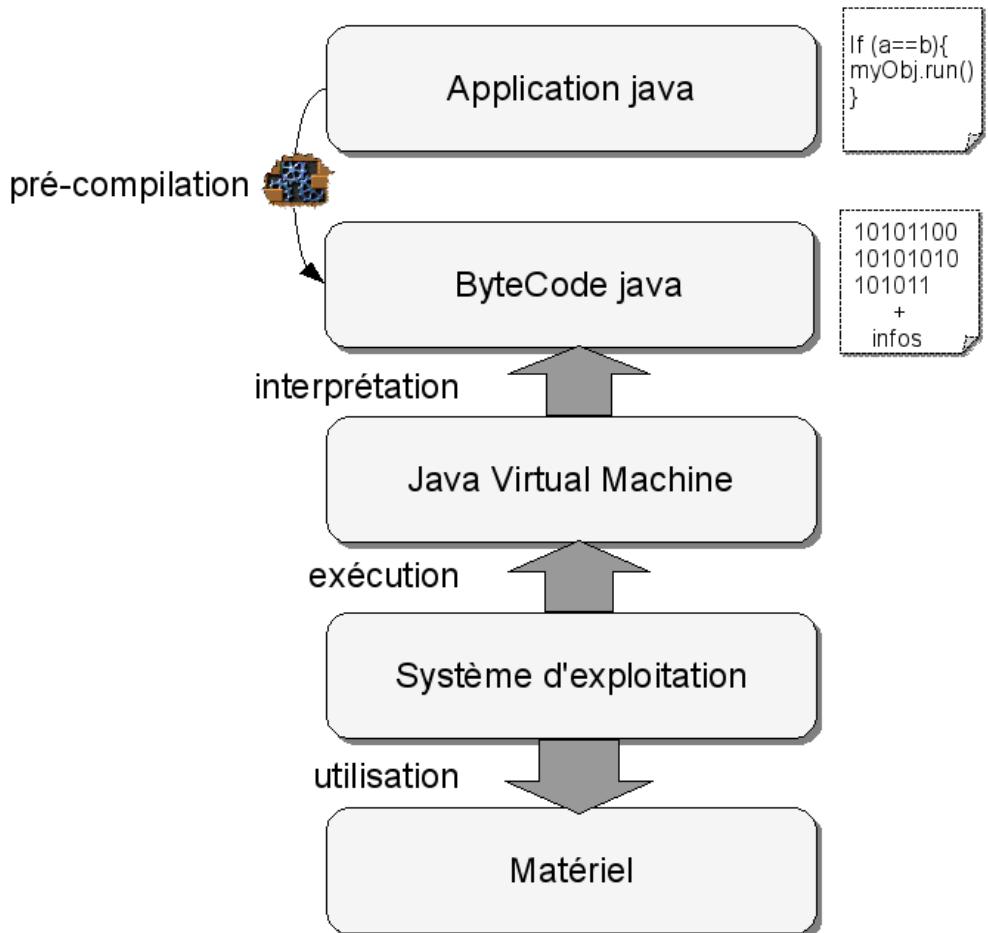

- JAVA est plus simple
 - gestion automatique de la mémoire (garbage collector)
 - IDE mieux fait ?
- mais aussi plus limité que C++
 - Pas de gestion fine de la mémoire,
 - Pas de surcharge des opérateurs,
 - Pas d'héritage multiple
 - Pas d'héritage privé
 - Mécanismes orientés objets imposés
 - Performance des IO
 - Peu de gestion fine de la synchronisation des threads
 - ...

Noter que depuis quelques années, Java et son évolution sont dirigés par Oracle...

Différences avec JAVA

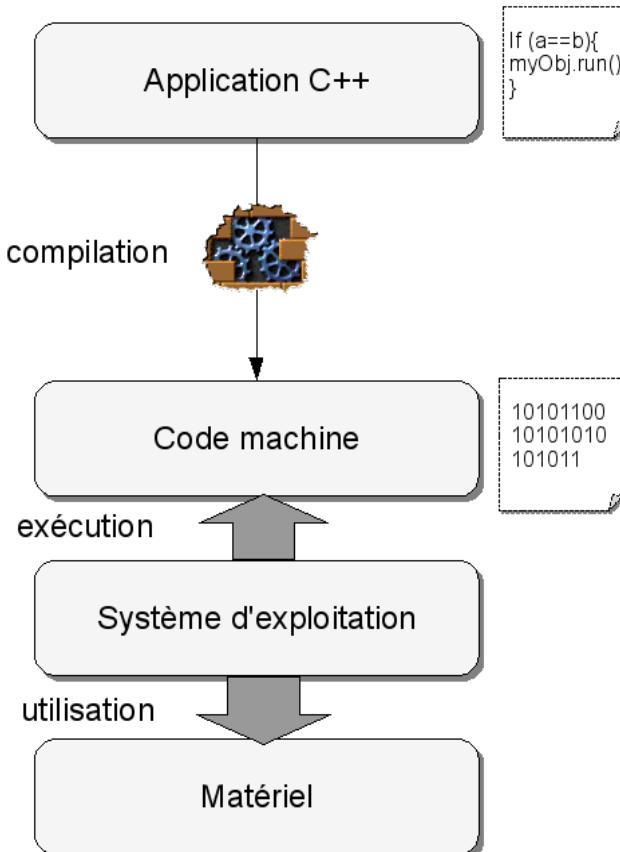

la mise en oeuvre

- JAVA est pré-compilé puis interprété
- C++ est compilé

la mise en oeuvre

- JAVA est pré-compilé puis interprété
- C++ est compilé

From C to C++

Programming and abstraction

- ▶ **Procedures (and functions)**
 - ▶ Stress on structuring control flow
 - ▶ Less concern for structuring data

Le langage C

▶ Pros

- ▶ High level language (Pascal style)
- ▶ **User definable data types**
- ▶ Well-suited to system programming and Unix
- ▶ **Support separate compiling**
- ▶ **Portable**
- ▶ **Efficient compilers**

Le langage C

▶ Pros

- ▶ High level language (Pascal style)
- ▶ **User definable data types**
- ▶ Well-suited to system programming and Unix
- ▶ **Support separate compiling**
- ▶ **Portable**
- ▶ **Efficient compilers**

▶ Cons

- ▶ **Weak typing**
- ▶ Incomplete
- ▶ no IO statements
- ▶ no parallel statements
- ▶ no string manipulation statements
- ▶ no complex number, no global array manipulation...
- ▶ **Impossible to extend**
- ▶ Old fashioned approach to separate compiling and modularity

From C to C++

Strong typing(1)

- ▶ ANSI C strong typing
 - ▶ Every object (constant, variable, function) has a type which must be known before the object is used
 - ▶ The compiler performs type checking (static analysis)
 - ▶ C/C++ makes it possible to mix data types in case of “natural” conversions (e.g. integer to real)
 - ▶ The type of a function (its signature) is given by a prototype specifying
 - ▶ the number of arguments and their types
 - ▶ the type of the return value

double cos(double);

From C to C++

Strong typing(1)

- ▶ ANSI C strong typing
 - ▶ Every object (constant, variable, function) has a type which must be known before the object is used
 - ▶ The compiler performs type checking (static analysis)
 - ▶ C/C++ makes it possible to mix data types in case of “natural” conversions (e.g. integer to real)
 - ▶ The type of a **function** (its **signature**) is given by a **prototype** specifying
 - ▶ the number of arguments and their types
 - ▶ the type of the return value

double cos(double);

*This is the **declaration** of a function. (but here it is not **defined**, yet)*

From C to C++

Strong typing(2)

- ▶ Strong typing makes it possible to overload operators and functions
 - ▶ the same name for several functions distinguished by their signature
 - ▶ overloading is specific to C++

```
double cos(double);  
complex cos(complex);
```

From C to C++

Programming and abstraction

- ▶ **Procedures** (and functions)
 - ▶ Stress on structuring control flow
 - ▶ Less concern for structuring data
- ▶ **Modules**
 - ▶ Group together data and procedures manipulating the data
 - ▶ Access control, information hiding, encapsulation
 - ▶ Separate the specification (interface) from the implementation (body)

From C to C++

Programming and abstraction

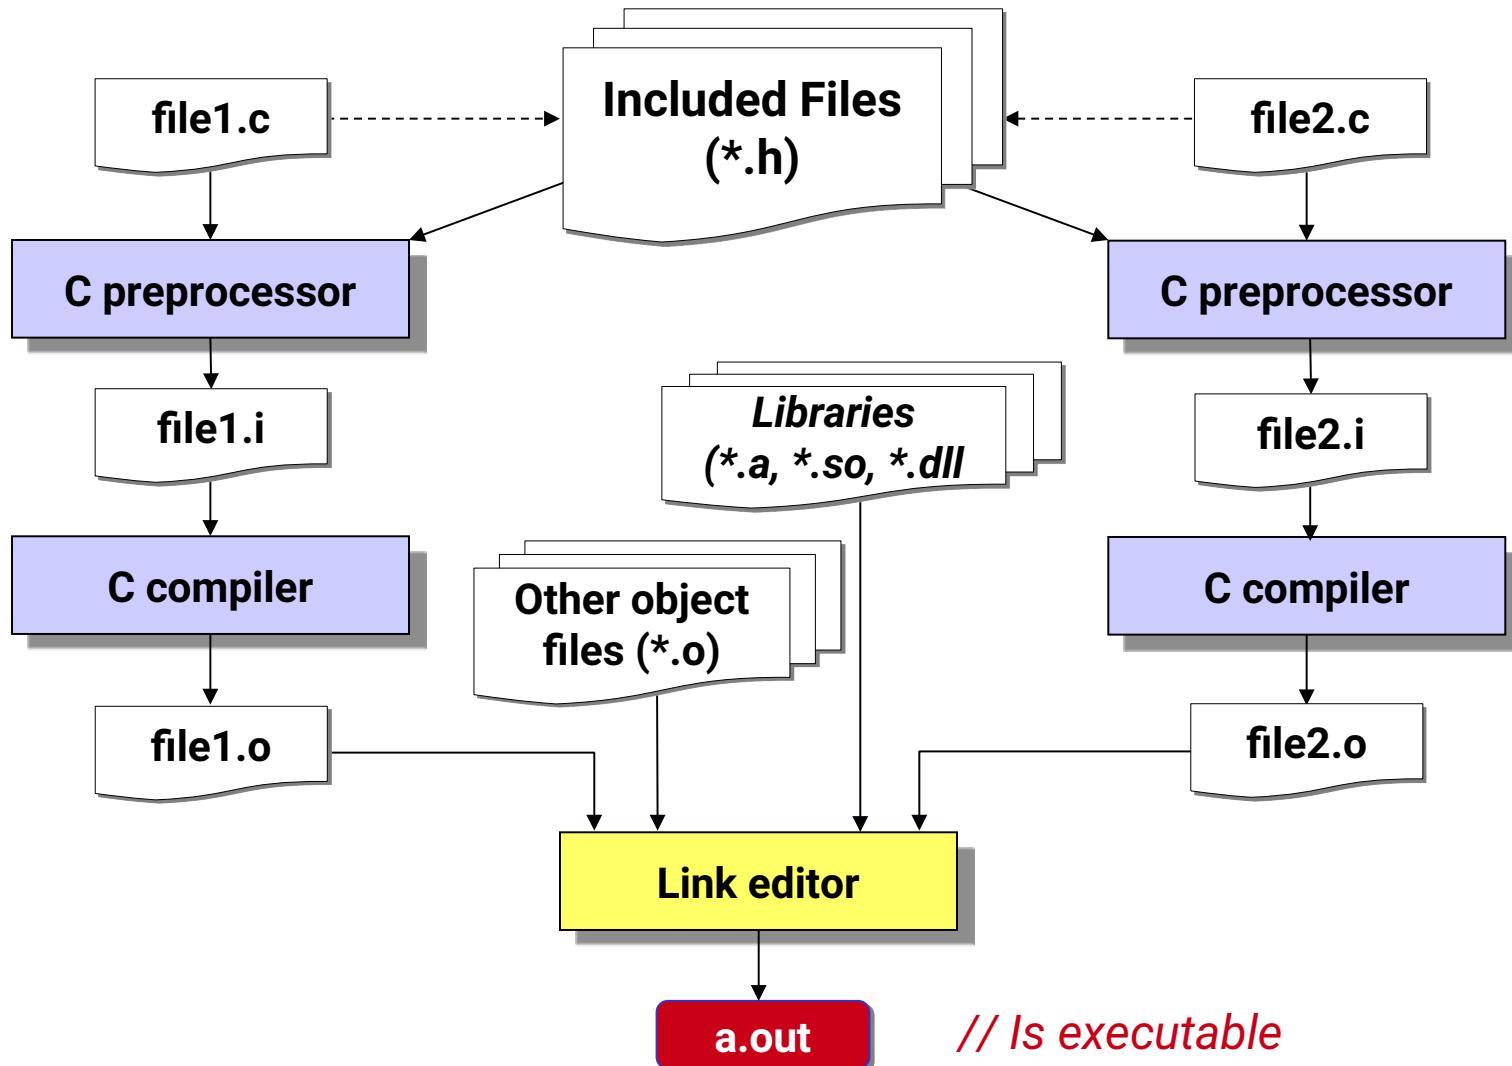

- ▶ **Procedures** (and functions)
 - ▶ Stress on structuring control flow
 - ▶ Less concern for structuring data
- ▶ **Modules**
 - ▶ Group together data and procedures manipulating the data
 - ▶ Access control, information hiding, encapsulation
 - ▶ Separate the specification (interface) from the implementation (body)
- ▶ **Abstract data types**
 - ▶ The module is turned into a type
 - ▶ One may declare instances (i.e. objects) of this type

From C to C++

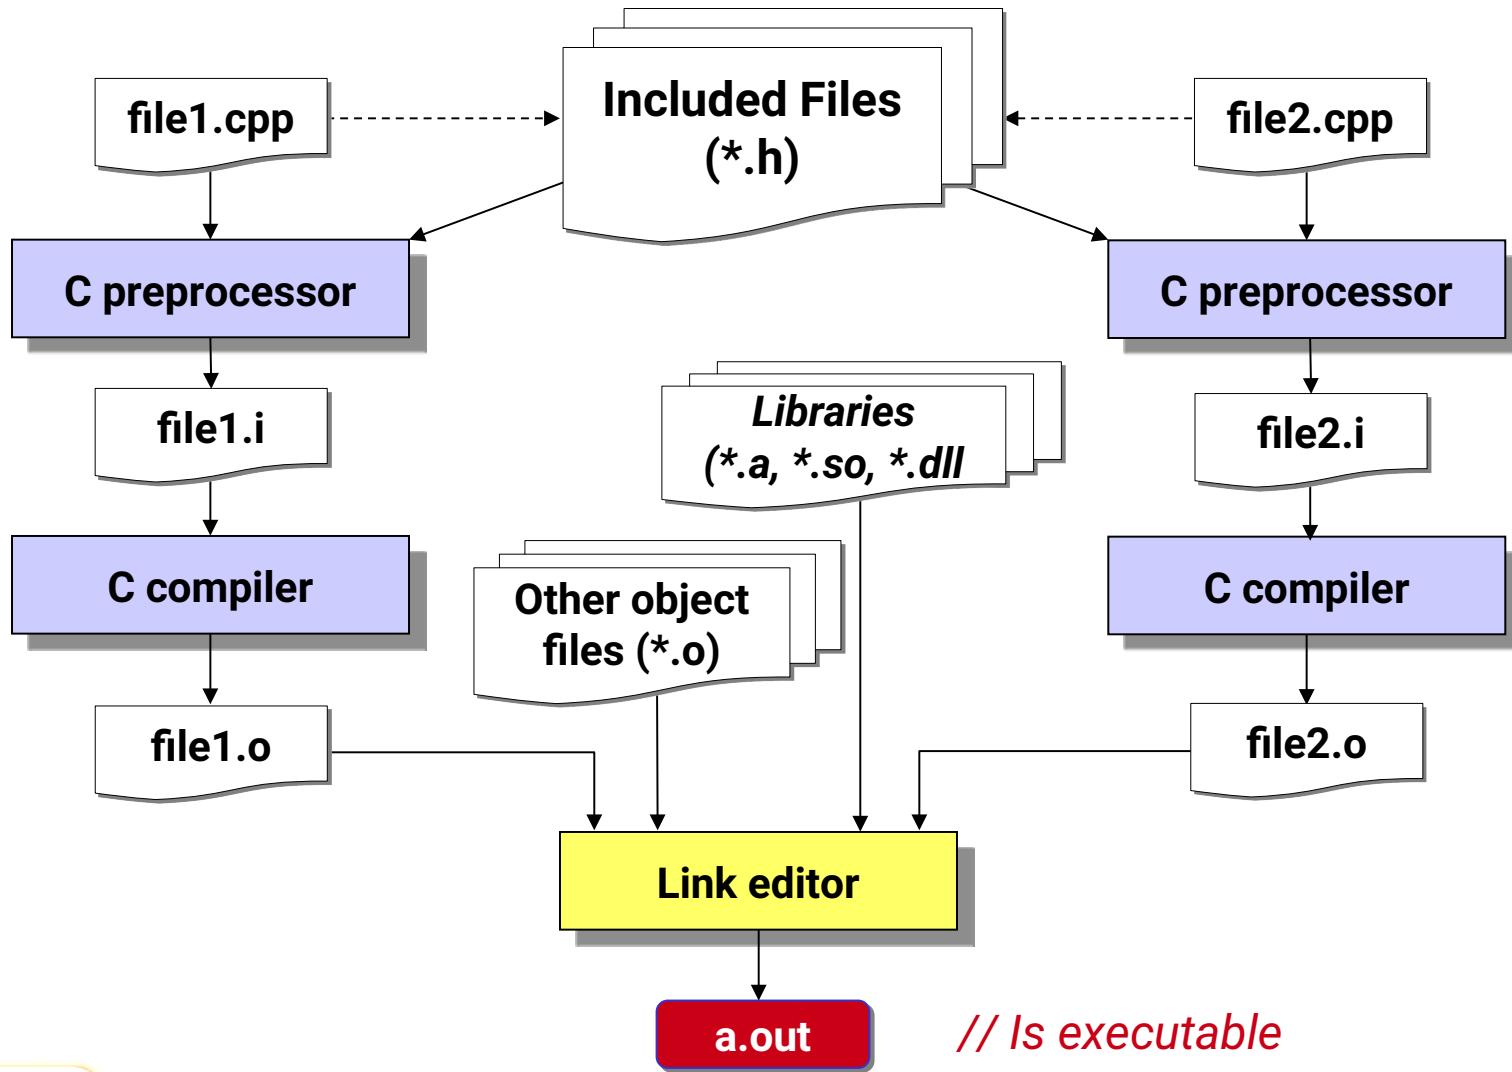

Programming and abstraction

- ▶ **Procedures** (and functions)
 - ▶ Stress on structuring control flow
 - ▶ Less concern for structuring data
- ▶ **Modules**
 - ▶ Group together data and procedures manipulating the data
 - ▶ Access control, information hiding, encapsulation
 - ▶ Separate the specification (interface) from the implementation (body)
- ▶ **Abstract data types**
 - ▶ The module is turned into a type
 - ▶ One may declare instances (i.e. objects) of this type
- ▶ **Object-orientation**
 - ▶ Hierarchy among abstract data types (inheritance)
 - ▶ Dynamic (run-time) resolution of the exact type of an object (dynamic typing, late binding, polymorphism)

```
clean:
```

```
    rm *.o $(EXE_NAME)
```

Makefile

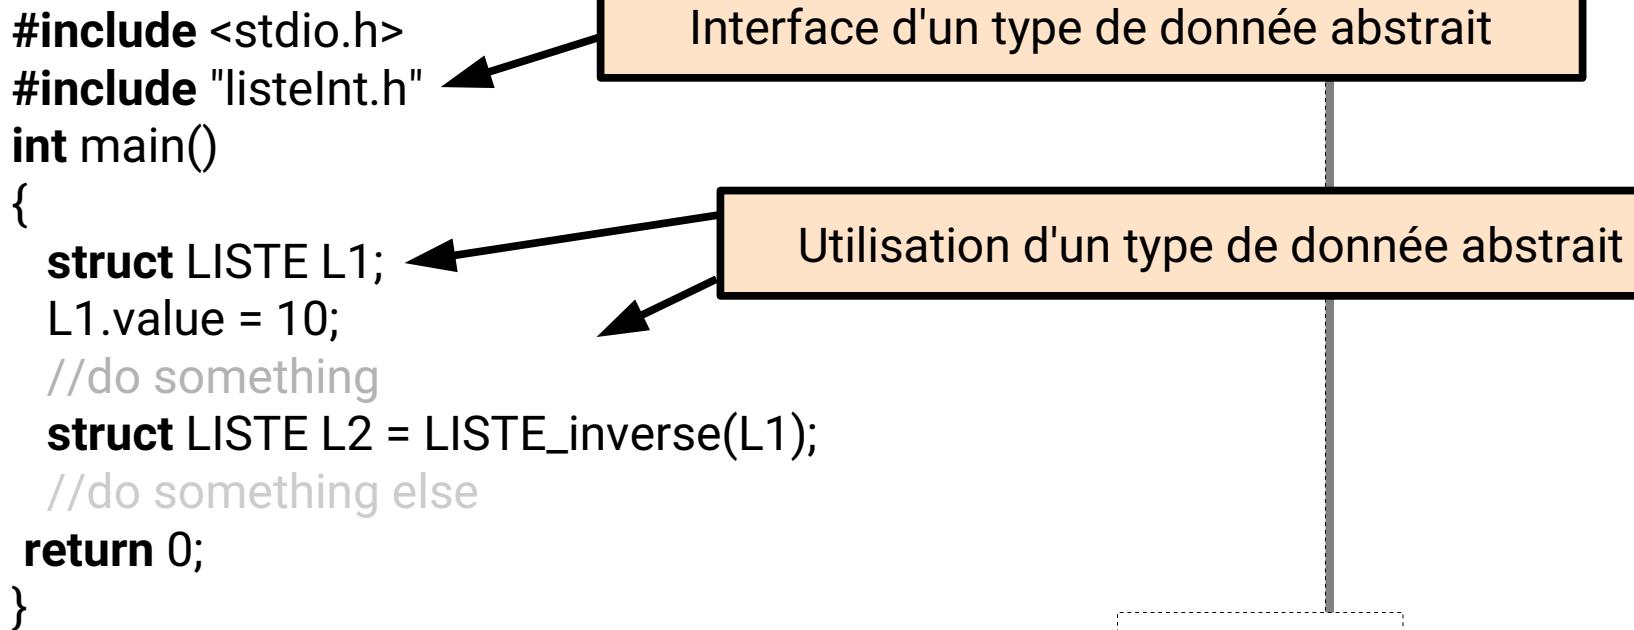

```
jdeanton@FARCI:$ make clean ←
jdeanton@FARCI:$ ./executable
bash: ./executable: No such file or directory
jdeanton@FARCI:$
```

Lancement de la compilation
de la cible « clean »

Le langage C *Les types de données abstraits*

Exemple en langage C

```
#include <stdio.h>
#include "listelInt.h"
int main()
{
    struct LISTE L1;
    L1.value = 10;
    //do something
    struct LISTE L2 = LISTE_inverse(L1);
    //do something else
    return 0;
}
```

The diagram illustrates the relationship between the code and its corresponding abstract data type concepts. It consists of three main components:

- A large rectangular box at the top labeled "Interface d'un type de donnée abstrait". An arrow points from the first two lines of the code ("#include <stdio.h>" and "#include "listelInt.h""), indicating that these lines define the interface of an abstract data type.
- A second rectangular box labeled "Utilisation d'un type de donnée abstrait". An arrow points from the declaration of the variable "L1" and its assignment ("L1.value = 10;"), indicating that this part of the code uses an abstract data type.
- A small rectangular box at the bottom right labeled "main.c", which contains a dashed vertical line connecting it to the "Utilisation" box, indicating that the entire code block is contained within the main.c file.

Exemple en langage C

```
#include <stdio.h>
```

```
typedef struct List{  
    int value;  
    struct LISTE * suivant;  
}LISTE;
```

```
LISTE LISTE_inverse(LISTE);
```

Définition structurelle du type de donnée abstrait

Signature / prototype / déclaration d'une fonction associée au type

listelnt.h

Exemple en langage C

```
#include "listInt.h"

LISTE LISTE_inverse(LISTE L){
    //do the appropriate algorithm...
    return L;
}
```

Définition
d'une fonction associée au type

listInt.c

Programming and abstraction

compiler avec un « make » en langage C

```
# sketchy makefile example
```

```
EXE_NAME=executable
```

```
LINK_C=gcc
```

```
COMPILE_C=gcc -c
```

example: main.o **listInt.o**

```
$(LINK_C) main.o listInt.o -o $(EXE_NAME)
```

main.o: main.c

```
$(COMPILE_C) main.c
```

listInt.o: listInt.c listInt.h

```
$(COMPILE_C) listInt.c
```

Makefile

Programming and abstraction

- ▶ Différents moments disjoints de la programmation :
 - ▶ La réalisation de type de données abstrait
 - ▶ Déclarer une (des) structures(s) (+ les fonctions associées) → .h
 - ▶ Implémenter la (les) fonctions associées(s) → .c
 - ▶ La réalisation du main
 - ▶ Utiliser des types de données:
 - ▶ Qui sont prédéfinis (int, char, etc)
 - ▶ Que l'on a défini (les structures...)

Programming and abstraction

Le langage C++

Programming and abstraction

quoi de plus dans le C++ ?

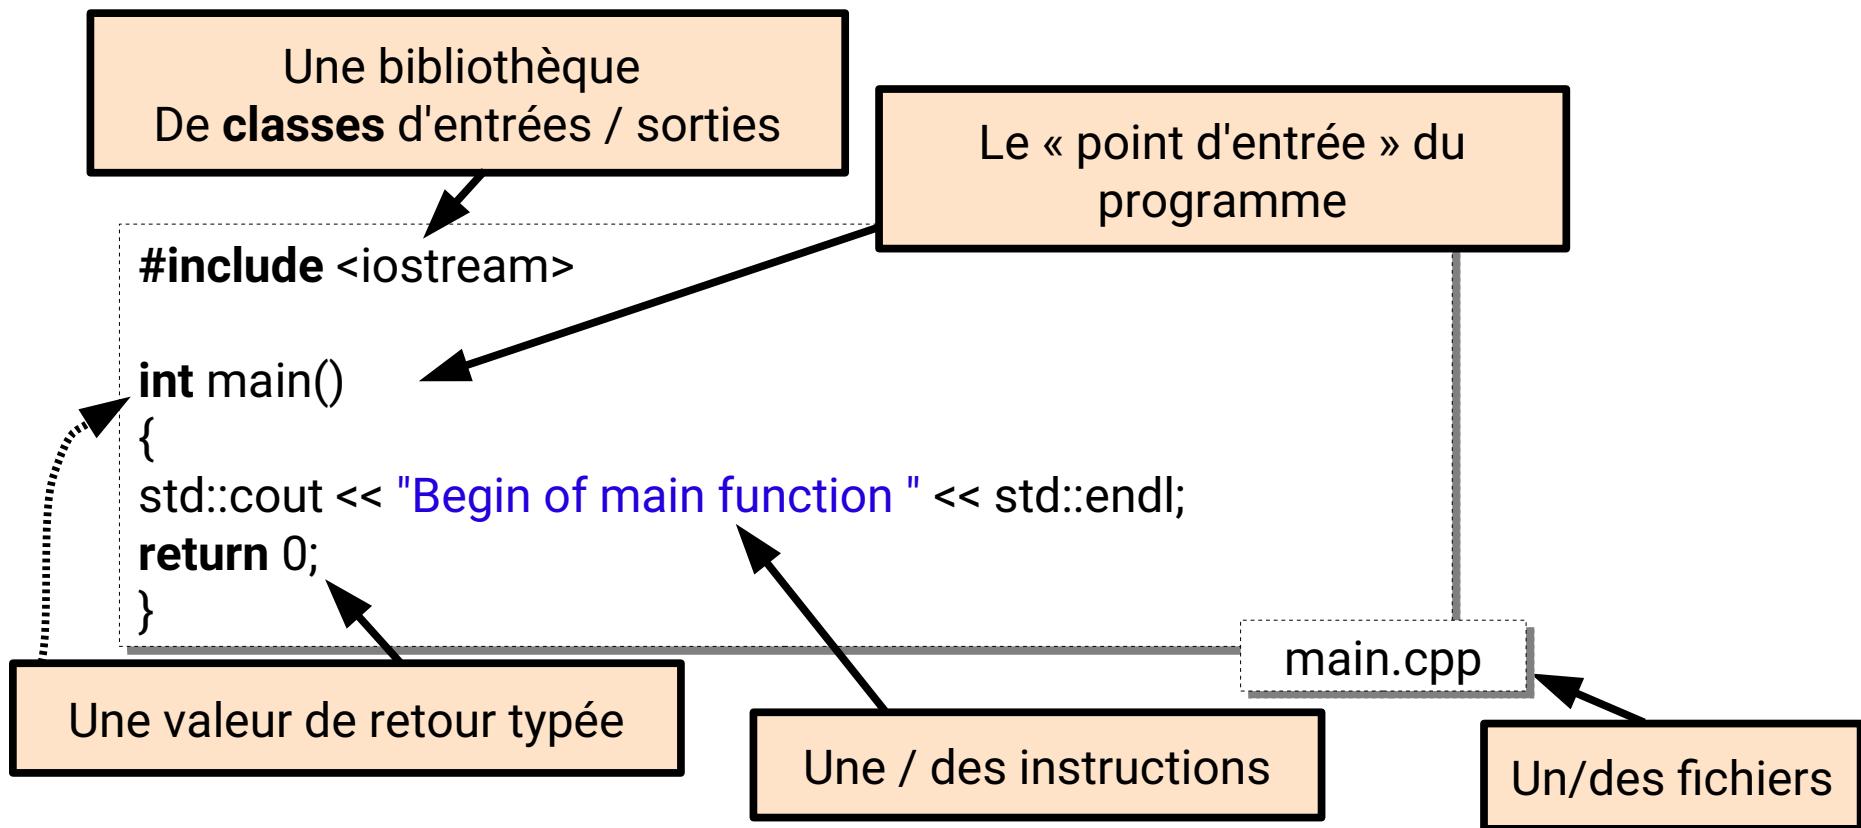

- ▶ Un typage fort
 - ▶ Surcharge de fonctions, d'opérateurs
- ▶ De la généricité : templates...
- ▶ La STL : Standard Template Library
 - ▶ Containers
 - ▶ Algorithms
 - ▶ ...
- ▶ Toutes les notions de ADT et orientées objets
 - ▶ Encapsulation / notion de visibilité
 - ▶ Hiérarchie entre les types de données (héritage)
 - ▶ Résolution dynamique (à l'exécution) du type effectif d'un objet (typage dynamique, polymorphisme), **uniquement lorsque nécessaire et demandé par le développeur**
- ▶ C++11, 14, 17, 20
 - ▶ Lambda expressions, gestion de la concurrence, inférence de type, ...

Programmation orientée objet*

Classe ou pas classe ?

- ▶ Différents moments disjoints de la programmation :
- ▶ **La réalisation de classe**
- ▶ **La réalisation du main**

Classe ou pas classe ?

- ▶ Différents moments disjoints de la programmation :
- ▶ La réalisation de classe
- ▶ La réalisation du main

**Un code / programme ne contient
pas forcément les deux !**

Classe ou pas classe ?

- ▶ Différents moments disjoints de la programmation :
- ▶ **La réalisation de classe**
- ▶ **La réalisation du main**
- ▶ Utiliser des classes :
 - ▶ Qui sont Prédéfinies (par exemple celles de la STL)
 - ▶ Que l'on a défini

Classe ou pas classe ?

► Différents moments disjoints de la programmation :

► **La réalisation de classe**

- Déclarer une (des) classe(s) → **.h**
- ≈ faire le diagramme de classe
- Implémenter la (les) classe(s) → **.cpp**
- ≈ implémenter les opérations (diagrammes d'activités, stateCharts, diagrammes de séquence, etc)

► **La réalisation du main**

- Utiliser des classes :
 - Qui sont Prédéfinies (par exemple celles de la STL)
 - Que l'on a défini (voir point 1.)

Utilisation de classes existantes

```
#include <iostream>
#include <string>

int main()
{
    std::cout << "Begin of main function " << std::endl;

    std::string aString="My first C++ string";
    std::cout << "\t" << aString << std::endl;

    aString.append(" !!!!!!! ");
    std::cout << "\t" << aString << std::endl;
    return 0;
}
```

main.cpp

Utilisation de classes existantes

```
#include <iostream>
#include <string>

int main()
{
    std::cout << "Begin of main function " << std::endl;

    std::string aString="My first C++ string";
    std::cout << "\t" << aString << std::endl;

    aString.append(" !!!!!!! ");
    std::cout << "\t" << aString << std::endl;
    return 0;
}
```

Inclusion de la bibliothèque
associée à la classe

main.cpp

Utilisation de classes existantes
